
Datasheet for Lenze ST17H26

DS-ST17H26

Ver 1.5.0

2015/10/26

Keyword:

Features; Package; Pin layout; Memory; MCU;
Working mode; Wakeup source; RF Transceiver;
Baseband; Clock; Timers; Interrupt; Interface;
QDEC; ADC; PWM; Electrical specification; Application

Brief:

This datasheet is dedicated for Lenze low cost BLE+2.4G dual mode SoC ST17H26. In this datasheet, key features, working modes, main modules, electrical specification and application of the ST17H26 are introduced.

**Revision History**

Version	Major Changes	Date	Author
1.0	Initial release	2015/4	S.G.J., Y.C.Q, F.F., L.Y., Cynthia
1.1.0	Updated package dimension figure (Figure 1-2 in section 1.5), and section 1.2.2~1.2.3, 12.3~12.4	2015/6	X.S.J., L.Y., Cynthia
1.2.0	Added ordering information, package dimension, pin layout, GPIO lookup tables, pull-up/pull-down resistor and schematic for SOP16 package; Updated GP4&GP5 pin multiplexed function (I2C) for QFN24 package.	2015/7	S.G.J., L.X., H.Z.F., X.S.J., L.Y., Cynthia
1.3.0	Added IO drive strength information	2015/7	L.Y., Cynthia
1.4.0	Added TSSOP16 package information	2015/8	X.S.J., L.Y., Cynthia
1.5.0	Deleted IR mode	2015/10	L.Y., Cynthia

1 Overview

The ST17H26 is Lenze-developed ultra-low cost BLE and 2.4G dual mode SoC solution which is fully standard compliant and allows easy connectivity with Bluetooth Smart Ready mobile phones, tablets, laptops. It's completely RoHS-compliant and 100% lead (Pb)-free.

1.1 Block diagram

The ST17H26 is designed to offer ultra-low cost, low power Bluetooth Smart application capabilities, which integrates powerful 32-bit MCU, advanced BLE/2.4G Radio, 16KB on-chip OTP, 6KB on-chip SRAM, a 10bit ADC, a quadrature decoder (QDEC), up to four-channel PWM, abundant I/O interfaces, and nearly all of the peripheral blocks needed for Bluetooth Low Energy applications development.

The system's block diagram is as shown in Figure 1-1:

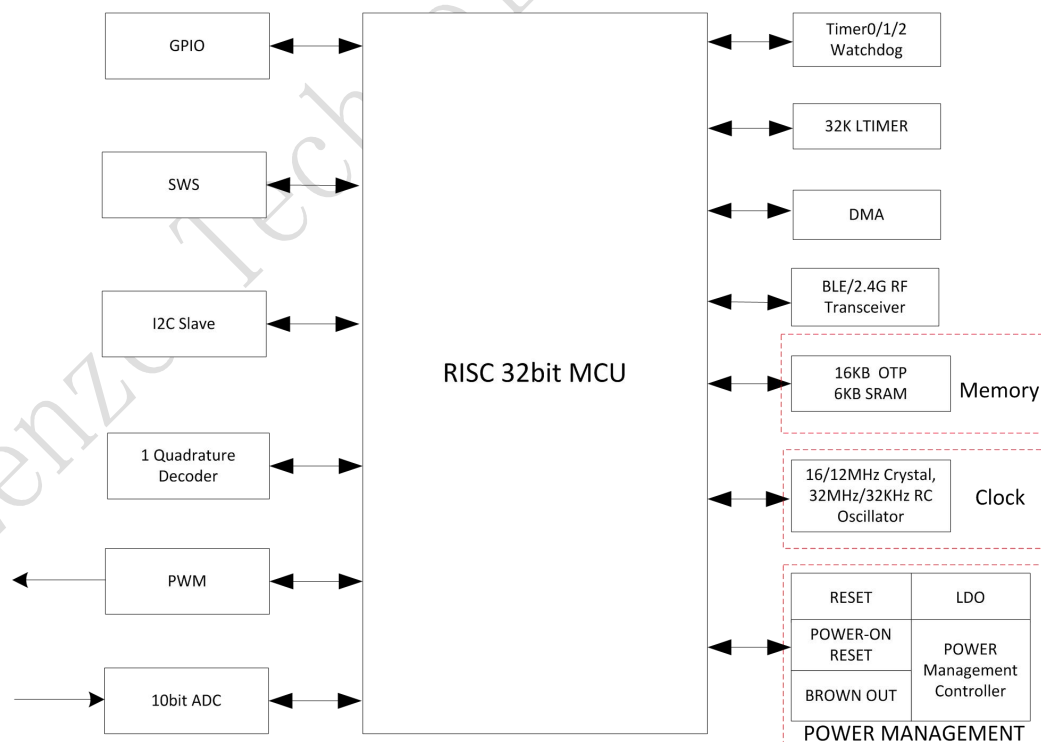

Figure 1- 1 Block diagram of the system

Based on the ST17H26 with high-volume-assembly and high integration, few external

components are needed to satisfy customers' ultra-low cost requirement.

1.2 Key features

1.2.1 General features

General features are as follows:

- 1) Embed 32-bit high performance MCU with clock up to 48MHz.
- 2) Program memory: 16KB on-chip OTP.
- 3) Data memory: 6KB on-chip SRAM.
- 4) 16/12MHz Crystal and 32KHz/32MHz embedded RC oscillator.
- 5) Up to 9 GPIOs, with configurable internal pull-up or pull-down resistors.
- 6) Debug interface: SWS (Single Wire Slave).
- 7) Supports I2C Slave interface.
- 8) Embeds a SAR ADC: Up to 10bit resolution and 4 input channels.
- 9) Embeds one quadrature decoder (QDEC).
- 10) Supports four-channel PWM output.
- 11) Embeds three general 32-bit timers Timer0~Timer2.
 - ✧ Timer0~Timer2 are available in active mode
 - ✧ Timer0~Timer1 supports four modes
 - ✧ Generally Timer2 is programmable as watchdog
- 12) A low-frequency 32K timer LTIMER available in suspend mode or deep sleep mode.
- 13) Operating temperature: -40°C~+85°C industrial temperature range.

1.2.2 RF Features

RF features include:

- 1) BLE/2.4GHz RF transceiver embedded, working in worldwide 2.4GHz ISM band.
- 2) Adaptive frequency hopping.
- 3) Bluetooth 4.0 Compliant, 1Mbps data rate mode.
- 4) Rx Sensitivity: -94dBm at 1Mbps mode.
- 5) Tx output power up to +6dBm.

- 6) Auto acknowledgement and retry.
- 7) Single-pin antenna interface.
- 8) RSSI monitoring.

1.2.3 Features of power management module

Features of power management module include:

- 1) Power supply of 1.9V~3.6V.
- 2) Embedded LDO.
- 3) Battery monitor: Embedded low battery detection.
- 4) Multiple stage power management to minimize power consumption.
- 5) Low power consumption:
 - ✧ Continuous Tx transmission: average current 15mA
 - ✧ Continuous Rx reception: average current 12mA
 - ✧ Suspend mode current: 10uA
 - ✧ Deep sleep mode current: 0.7uA

1.3 Typical application

The ST17H26 is typically used for BLE (Bluetooth Low Energy) applications.

- ✧ Beacon
- ✧ Find Me
- ✧ Selfie Shutter

1.4 Ordering information

Table 1- 1 Ordering information of the ST17H26

PRODUCT	PACKAGE TYPE	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
ST17H26	16-pin TSSOP16 4.96X6.4 mm	-40°C to +85°C	ST17H26ES16	ST17H26 ES16CL	Large Tape and Reel, 3000
				ST17H26ES16CT	Small Tape and Reel, 300
				ST17H26ES16C	Rail, 60

1.5 Package

For the ST17H26, 16-pin TSSOP16 4.96X6.4 mm package option is available. Package dimension for the ST17H26ES16 are shown as Figure 1-2.

SYMBOL	MILLIMETER		
	MIN	NOM	MAX
A	—	—	1.20
A1	0.05	—	0.15
A2	0.90	1.00	1.05

1.6 Pin layout

Pin assignment for the ST17H26ES16 is as shown in Figure 1-3:

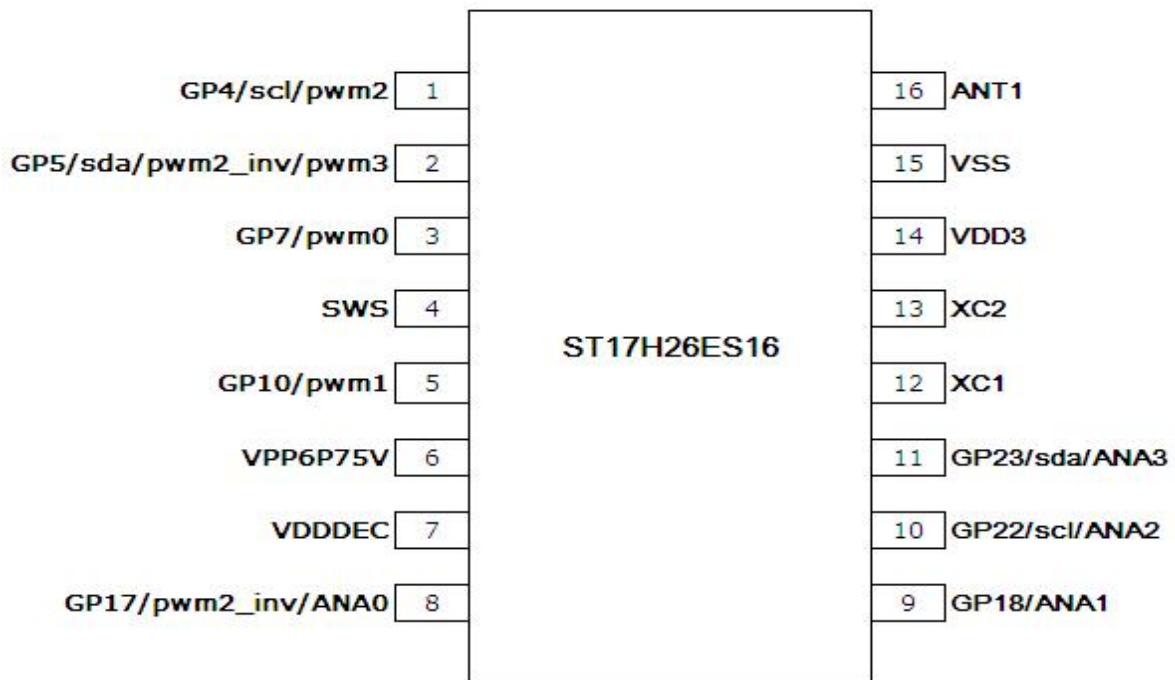

Figure 1- 3 Pin assignment for the ST17H26

Functions of 16 pins for the ST17H26S16 are described in Table 1-2:

Table 1- 2 Pin functions for the ST17H26S16

TSSOP16_4.96X6.4			
No.	Pin Name	Pin Type	Description
1	GP4/scl/pwm2 #	Digital I/O	GPIO4/I2C_SCL/PWM2 output
2	GP5/sda/pwm2_inv/ pwm3 #	Digital I/O	GPIO5/I2C_SDA/PWM2 inverting output/PWM3 output
3	GP7/pwm0 #	Digital I/O	GPIO7/PWM0 output
4	SWS	Digital I/O	single wire slave/GPIO
5	GP10/pwm1 #	Digital I/O	GPIO10/PWM1 output
6	VPP6P75V	POWER	for OTP program 6.75V power supply
7	VDDDEC	PWR	Digital LDO 1.8V output
8	GP17/pwm2_inv/ANA0 *	Digital I/O	GPIO17/PWM2 inverting output/Analog input 0 for SAR ADC

TSSOP16_4.96X6.4			
No.	Pin Name	Pin Type	Description
9	GP18/ANA1 *	Digital I/O	GPIO18/Analog input 1 for SAR ADC
10	GP22/scl/ANA2 *	Digital I/O	GPIO22/I2C_SCL/Analog input 2 for SAR ADC
11	GP23/sda/ANA3 *	Digital I/O	GPIO23/I2C_SDA/Analog input 3 for SAR ADC
12	XC1	Analog I/O	16MHz crystal input+
13	XC2	Analog I/O	16MHz crystal input-
14	VDD3	PWR	3.3V supply
15	VSS	GND	ground for the whole chip
16	ANT1	Analog I/O	RF antenna

*Note:

- (1) Pins with bold typeface can be used as GPIOs. Please refer to **Section 8.1** for details.
- (2) The pins marked with an asterisk support configurable internal 1MΩ/10KΩ pull-up resistor or 100KΩ pull-down resistor which are disabled by default. The pins marked with a pound sign support internal 100KΩ pull-down resistor which is disabled by default. Please refer to **Section 8.4** for details about pull-up/pull-down resistor.
- (3) The I2C interface only supports Slave mode.
- (4) Pin drive strength: All the GPIO pins support drive strength of 4mA or 0.7mA (4mA when "DS"=1, 0.7mA when "DS"=0) with the following exception: SWS supports drive strength of 8mA or 4mA (8mA when "DS"=1, 4mA when "DS"=0). "DS" configuration will take effect when the pin is used as output. Please refer to **Section 8.1** GPIO for corresponding "DS" register address and the default setting.

1.7 Lenze SDK

A full featured SDK is provided with the chip for BLE applications. This chip also supports AES-128 encryption. The customer can easily develop his own BLE applications by employing the firmware, along with the system configuration data composed according to the specific hardware design.

2 Memory

The ST17H26 embeds 6KB data memory (SRAM), and 16KB program memory (OTP).

SRAM/Register memory map is shown as follows:

Figure 2- 1 Physical memory map

Register address: from 0x800000 to 0x807FFF;

6KB SRAM address: from 0x808000 to 0x809800.

Both register and 6KB SRAM address can be accessed via I2C Slave and SWS interface.

OTP address mapping is configurable.

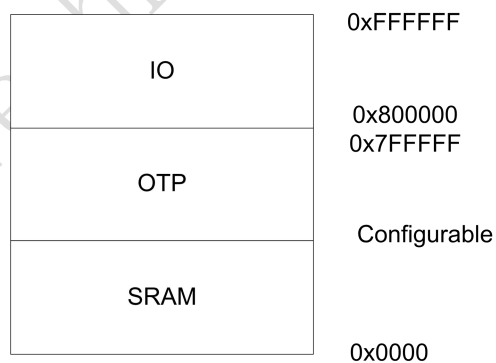

Figure 2- 2 MCU memory map

Address space starting from 0x800000 can be accessed via debug interface.

3 MCU

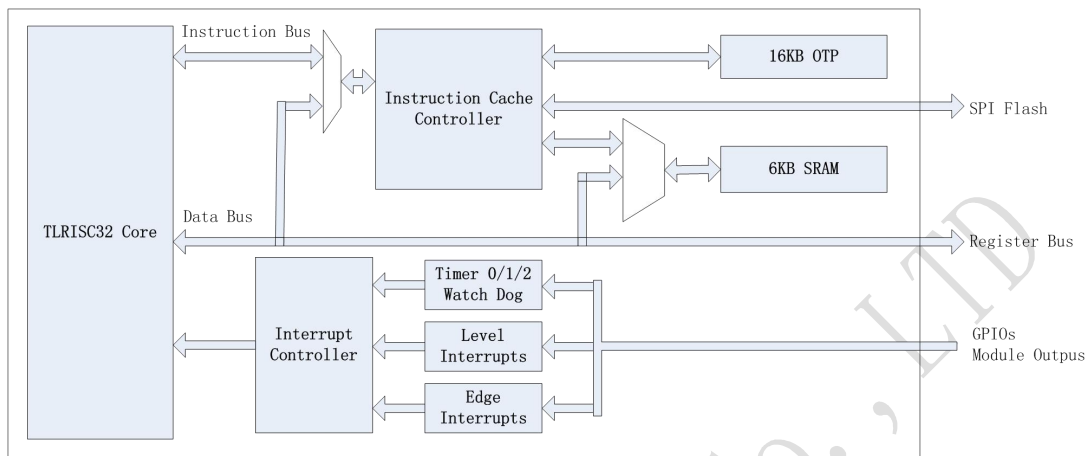

Figure 3- 1 Block diagram

The ST17H26 integrates a powerful 32-bit MCU developed by Lenze. The digital core is based on 32-bit RISC, and the length of instructions is 16 bits; four hardware breakpoints are supported.

3.1 Working modes

The ST17H26 has four working modes: Active, Idle, Suspend and Deep Sleep. This section mainly gives the description of every working mode and mode transition.

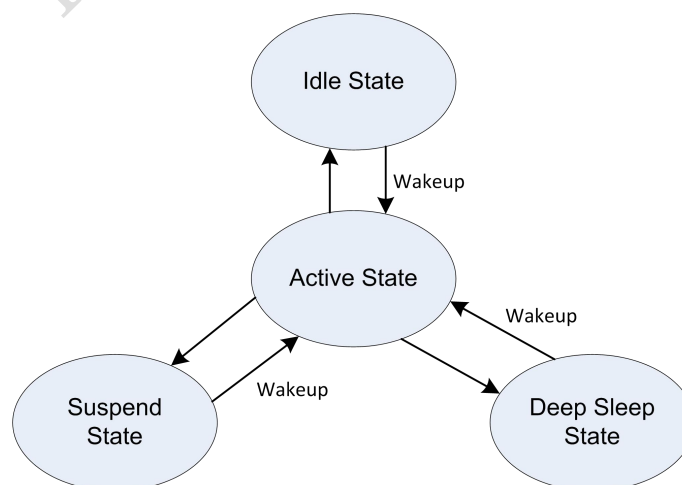

Figure 3- 2 Transition chart of working modes

3.1.1 Active mode

In active mode, the MCU block is at working state, and the ST17H26 can transmit or receive data via its embedded RF transceiver. The RF transceiver can also be powered down if no data transfer is needed.

3.1.2 Idle mode

In Idle mode, the MCU block stalls, and the RF transceiver can be at working state or be powered down. The time needed for the transition from Idle mode to Active mode is negligible.

3.1.3 Power-saving mode

3.1.3.1 Brief introduction

For the ST17H26, there are two kinds of power-saving modes: suspend mode and deep sleep mode. The two modes have similar transition sequences but different register settings. For 1.8V digital core, it's still provided with the working power by 1.8V LDO in suspend mode; while in deep sleep mode, the 1.8V LDO will be turned off, and the digital core is powered down.

In suspend mode, the RF transceiver is powered down, and the clock of the MCU block is stopped. It only takes about 400us for the ST17H26 to enter the active mode from suspend mode.

While in deep sleep mode, both the RF transceiver and the MCU block are powered down with only power management block being active. The transition time needed from deep sleep mode to active mode is 1ms, almost the same as power-up time.

3.1.3.2 Register configuration of power-saving mode

For the ST17H26, power-saving mode related registers are configurable via digital core and 3.3V analog registers.

Table 3- 1 Registers in digital core

Address	Mnemonic	Type	Description	Reset value
---------	----------	------	-------------	-------------

Address	Mnemonic	Type	Description	Reset value
0x6e	WAKEUPEN	R/W	Wakeup enable [0]: enable i2c wakeup when transaction [1]: enable QDEC wakeup [2]: rsvd [3]: enable wakeup from gpio [4]: enable i2c wakeup when slave ID matched System resume control [5]: enable GPIO remote wakeup [6]: rsvd [7] sleep wakeup reset system enable	00
0x6f	PWDNEN	W	[0]: suspend enable [5]: rst all (act as power on reset) [6]: mcu low power mode [7]: stall mcu trig If bit[0] set 1, then system will go to suspend. Or only stall mcu	

Address 0x6e serves to enable various wakeup sources from power-saving mode. Please refer to **Section 3.1.3.3** Wakeup source for details.

Table 3- 2 3.3V analog registers (afe3V_reg05 ~ afe3V_reg06) (bit)

Address(bit)	Mnemonic	Reset value	Description
afe3V_reg05<0>	32K_rc_pd	0	Power down 32KHz RC oscillator 1: Power down 32KHz RC oscillator 0: Power up 32KHz RC oscillator

3.1.3.3 Wakeup source

3.1.3.3.1 Wakeup source – GPIO

This wakeup source can only wake up the system from suspend mode.

First, set the right polarity of IO via the “Polarity” register (0x584, 0x58c, 0x594, 0x59c, 0x5a4). Polarity 1 indicates corresponding IO is active low, while 0 indicates corresponding IO is active high.

Second, set the right mask via the “Irq” register (0x587, 0x58f, 0x597, 0x59f, 0x5a7). 1: enable this IO as wakeup source; 0: disable this IO.

Third, set both the digital core address 0x6e bit[3] and 3v_reg23 bit[0] to 1 so as to activate this mode.

Please refer to **Section 8.1** GPIO for details about polarity and mask registers of each GPIO.

3.1.3.3.2 Wakeup source – QDEC

This wakeup source can only wake up the system from suspend mode.

First, digital core address 0x6e[1] should be set to 1b'1.

Second, address 3V_reg23 bit[0] should be set to 1b'1.

Third, addresses afe3V_reg05<0> and 3V_reg24 [0] should be cleared to power up 32K RC clock, then write 0x64[7] and 0x65[0] to 1.

After this wakeup source is enabled, once there's wheel rolling, square waves output are generated and the system is wakened.

3.1.3.3.3 Wakeup source – 32K timer

This wakeup source is able to wake up the system from suspend mode or deep sleep mode.

Address 3V_reg23 bit[1] is the enabling bit for wakeup source from 32k timer.

3.1.3.3.4 Wakeup source – pad

This wakeup source is able to wake up the system from suspend mode or deep sleep mode.

3v_reg23[2] should be set to 1b'1 to enable pad wakeup source.

3v_reg22 and 3v_reg43[2:0] are enabling signal for pad wakeup sources: 3v_reg22 bit[7:0] -> [GP24~GP17]; 3v_reg43 bit[2:0] -> [GP31, GP27, GP26]. 1: enable this IO as

wakeup source; 0: disable this IO.

Polarity is controlled by 3v_reg20[7:4] and 3v_reg43[6:4]: 3v_reg43[6] controls polarity of GP31, bit[5] controls polarity of GP27, bit[4] controls polarity of GP26; 3v_reg20 bit[4] controls polarity of GP17 and GP18, bit[5] controls polarity of GP19 and GP20, bit[6] controls polarity of GP21 and GP22, bit[7] controls polarity of GP23 and GP24. Polarity 1 indicates corresponding IO is active low, while 0 indicates corresponding IO is active high.

Lenze Technology Co., Ltd

3.1.3.4 Transition sequence

First, enable the target wakeup source, and disable other wakeup sources.

NOTE: In deep sleep mode, the wakeup_dig (including wakeup source-QDEC and wakeup source-GPIO, shown as Figure 3-3) can't be selected as wakeup source; the effective wakeup source is 32K timer or pad wakeup source.

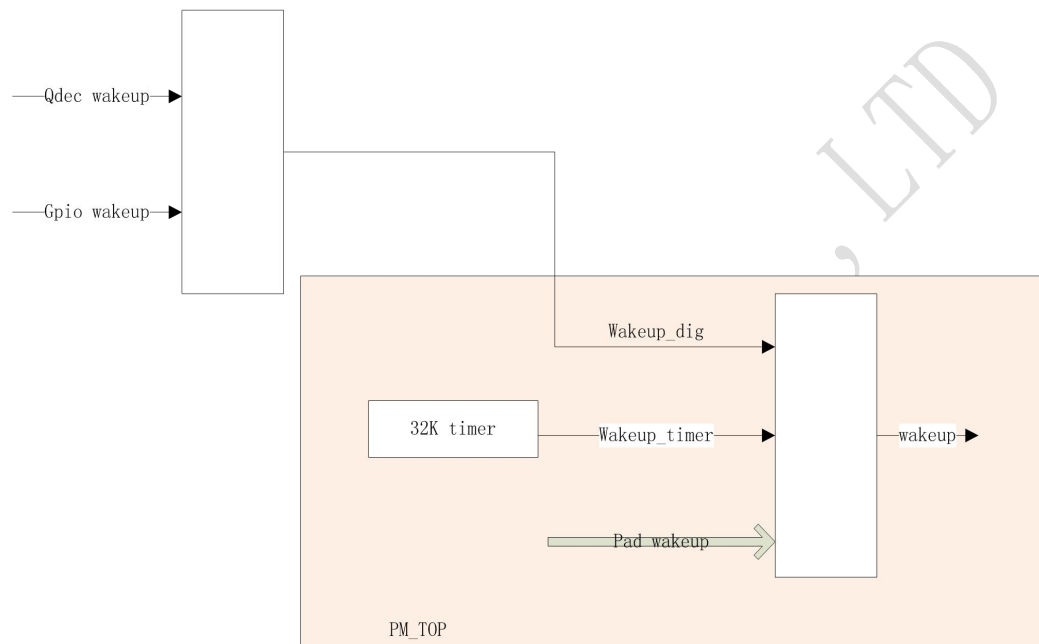

Figure 3- 3 Wakeup source

Second, select right power-saving mode: deep sleep mode or suspend mode. If deep sleep mode is to be selected, r24 bit[7] and bit[5] should be set to 1; r24 bit[7] and bit[5] should be cleared if suspend mode is to be selected.

Third, configure other enabling bits: set r23 bit[7] to 1; set r24 bits [3:0] to 1111, and also set r24 bit[6] to 1.

Fourth, Write data 0x81 to digital core address 0x6f to trigger the whole system. The system enters deep sleep mode or suspend mode (power-saving status depends on the setting of r24).

3.2 Reset

Except for power on reset, it is also feasible to carry out software reset for the whole chip or some modules. Setting address 0x6f[5] to 1b'1 is to reset the whole chip. Addresses 0x60~0x62 serve to reset individual modules: if some bit is set to logic "1", the corresponding module is reset.

Table 3- 4 Register configuration for reset, wakeup and power down enabling

Address	Mnemonic	Type	Description	Reset Value
0x60	RST0	R/W	Reset control, 1 for reset, 0 for clear [0]: mcu [1]: zb [2]: rsvd [3]: dma [4]: algm [5]: sws [6]: aif [7]: rsvd	00

4 2.4G RF Transceiver

4.1 Block diagram

The ST17H26 integrates advanced BLE/2.4GHz RF transceiver. The RF transceiver works in the worldwide 2.4GHz ISM (Industrial Scientific Medical) band and contains an integrated balun with a single-ended RF Tx/Rx port pin. No matching components are needed.

The transceiver consists of a fully integrated frequency synthesizer, a power amplifier, a modulator and a receiver. The transceiver works in standard-compliant BLE mode which supports FSK/GFSK modulations.

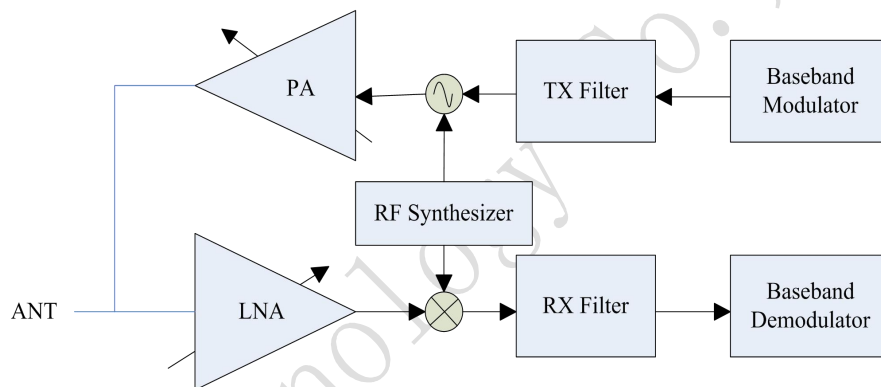

Figure 4- 1 Block diagram of RF transceiver

The internal PA can deliver a maximum 6dBm output power, avoiding the needs for an external RF PA.

4.2 Function description

Air interface data rate, the modulated signaling rate for RF transceiver when transmitting and receiving data, supports 1Mbps mode for the ST17H26.

For the ST17H26, RF transceiver can operate with frequency ranging from 2.400GHz to 2.4835GHz. The RF channel frequency setting determines the center of the channel.

4.3 Baseband

The baseband contains dedicated hardware logic to perform fast AGC control, access code correlation, CRC checking, data whitening, encryption/decryption and frequency hopping logic.

The baseband supports all features required by Bluetooth v4.0 specification.

4.3.1 Packet format

Packet format is shown as Table 4-1:

Table 4- 1 Packet Format

LSB		MSB	
Preamble (1 octet)	Access Address (4 octets)	PDU (2 to 39 octets)	CRC (3 octets)

Packet length 80bit ~ 376bit (80~376us @ 1Mbps).

4.3.2 RSSI

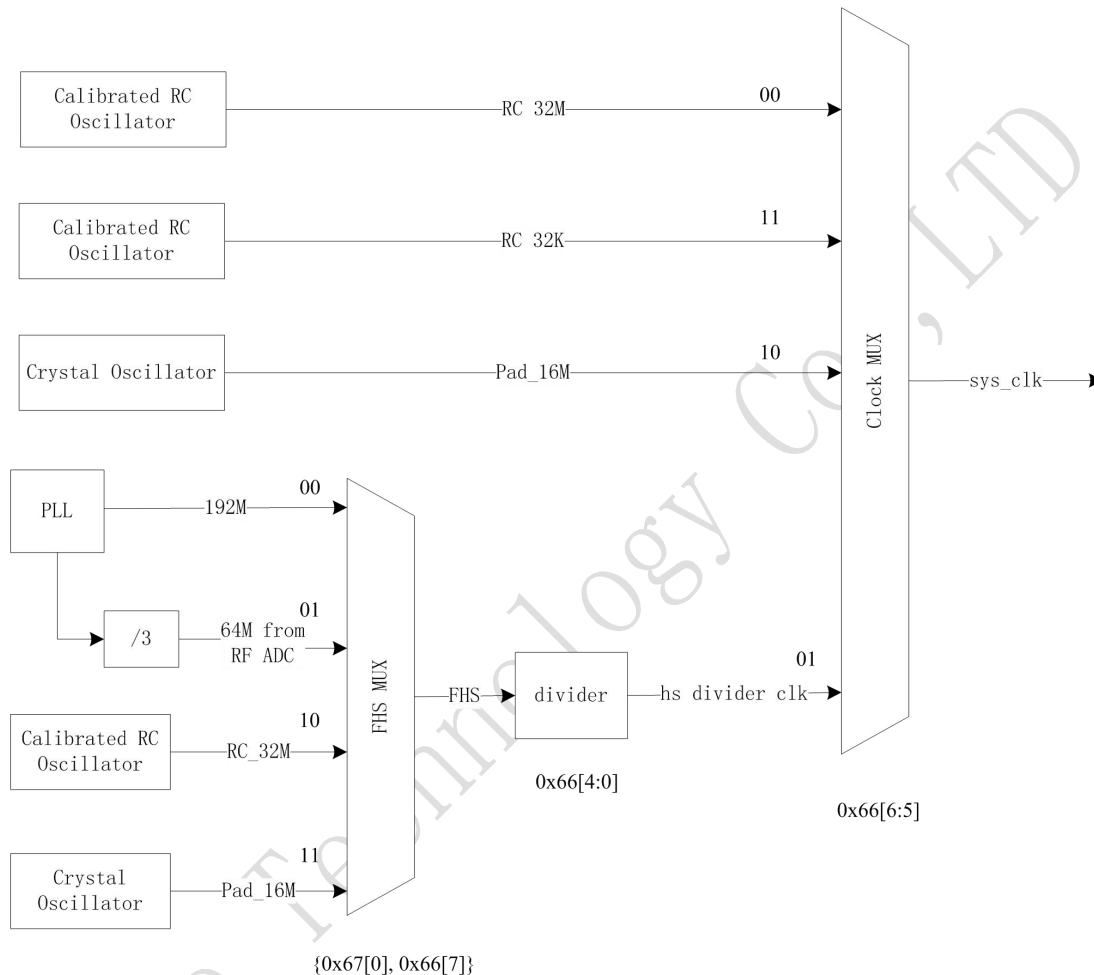

The ST17H26 provides accurate RSSI (Receiver Signal Strength Indicator) indication which can be read on per packet basis.

5 Clock

5.1 System clock

5.1.1 System clock sources

system clock, including: 32MHz RC oscillator, hs divider clock, 16MHz pad clock (external crystal oscillator) and 32KHz RC oscillator. Register CLKSEL (address 0x66[6:5]) is used to select system clock source.

Commonly a 16MHz crystal oscillator can be employed to generate a basic clock signal for the system. The maximum frequency tolerance of the crystal is $\pm 60\text{ppm}$. And a low-power RC oscillator can be used to generate a 32KHz clock signal for the wakeup timer.

5.1.2 FHS select

The high speed clock (FHS) is selectable via address {0x67[0], 0x66[7]} from the

following sources: 192MHz clock from PLL, 64MHz clock from RF ADC, 32MHz clock from RC oscillator or 16MHz pad clock (external crystal oscillator).

5.1.3 HS divider clock

If address 0x66[6:5] is set to 2b'01 to select the HS divider clock as system clock source, system clock frequency is adjustable via address 0x66[4:0]. $F_{\text{System clock}} = F_{\text{FHS}} / (\text{system clock divider value in address 0x66[4:0]} + 1)$.

5.2 Module clock

Registers CLKEN0~CLKEN2 (address 0x63~0x65) are used to enable or disable clock for various modules. By disable the clocks of unused modules, current consumption could be reduced.

5.2.1 SAR ADC clock

ADC clock derives from FHS. Address 0x6b[7] should be set to 1b'1 to enable ADC clock.

ADC clock frequency dividing factor contains step and mod.

Addresses 0x6b[6:4] and 0x69[7:0] serve to configure ADC_step[10:0].

Addresses 0x6b[3:0] and 0x6a[7:0] serve to configure ADC_mod[11:0].

ADC clock is calculated according to the formula below:

$$F_{\text{ADCclock}} = F_{\text{FHS}} * \text{adc_step}[10:0] / \text{adc_mod}[11:0]$$

5.3 Register table

Table 5- 1 Register table for clock

Address	Mnemonic	Type	Description	Reset Value
0x63	CLKEN0	R/W	Clock enable control: 1 for enable; 0 for disable [0] : mcu [1] : zb [2]: rsvd [3]: dma [4]: algm [5]: sws [6]: aif [7]: rsvd	8c

6 Timers

6.1 Timer0~Timer2

The ST17H26 supports three general 32-bit timers including Timer0~ Timer2 in active mode.

Timer0 and Timer1 support four modes: Mode 0 (System Clock Mode), Mode 1 (GPIO Trigger Mode), Mode 2 (GPIO Pulse Width Mode) and Mode 3 (Tick Mode).

Timer2 only supports Mode0 and Mode3. Generally Timer 2 is configured as “watchdog” to monitor firmware running.

6.1.1 Register table

Table 6- 1 Register configuration for Timer0~Timer2

Address	Mnemonic	Type	Description	Reset Value
0x620	TMR_CTRL0	RW	[0]Timer0 enable [2:1] Timer0 mode. 0 using sclk, 1, using gpio, 2 count width of gpi, 3 tick [3]Timer1 enable [5:4] Timer1 mode. [6]Timer2 enable [7]Bit of timer2 mode	00
0x621	TMR_CTRL1	RW	[0]Bit of timer2 mode [7:1]Low bits of watch dog capture	00

0x63a	TMR_TICK2_2	RW	Byte 2 of timer2 ticker	

Address	Mnemonic	Type	Description	Reset Value
0x63b	TMR_TICK2_3	RW	Byte 3 of timer2 ticker	

Lenze Technology Co., Ltd

6.1.2 Mode0 (System Clock Mode)

In Mode 0, system clock is employed as clock source.

After Timer is enabled, Timer Tick (i.e. counting value) is increased by 1 on each positive edge of system clock from preset initial Tick value. Generally the initial Tick value is set to 0.

Once current Timer Tick value matches the preset Timer Capture (i.e. timing value), an interrupt is generated, Timer stops counting and Timer status is updated.

Steps of setting Timer0 for Mode 0 is taken as an example.

1st: Set initial Tick value of Timer0

Set Initial value of Tick via registers TMR_TICK0_0~TMR_TICK0_3 (address 0x630~0x633). Address 0x630 is lowest byte and 0x633 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Capture value of Timer0

Set registers TMR_CAPT0_0~TMR_CAPT0_3 (address 0x624~0x627). Address 0x624 is lowest byte and 0x627 is highest byte.

3rd: Set Timer0 to Mode 0 and enable Timer0

Set register TMR_CTRL0 (address 0x620) [2:1] to 2b'00 to select Mode 0; Meanwhile set address 0x620[0] to 1b'1 to enable Timer0. Timer0 starts counting upward, and Tick value is increased by 1 on each positive edge of system clock until it reaches Timer0 Capture value.

6.1.3 Mode1 (GPIO Trigger Mode)

In Mode 1, GPIO is employed as clock source. The "m0"/"m1" register specifies the GPIO which generates counting signal for Timer0/Timer1.

After Timer is enabled, Timer Tick (i.e. counting value) is increased by 1 on each positive/negative edge of GPIO from preset initial Tick value. Generally the initial Tick value is set to 0. The "Polarity" register specifies the GPIO edge when Timer Tick counting increases.

Note: Refer to **Section 8.1.2** for corresponding "m0", "m1" and "Polarity" register address.

Once current Timer Tick value matches the preset Timer Capture (i.e. timing value), an interrupt is generated and timer stops counting.

Steps of setting Timer1 for Mode 1 is taken as an example.

1st: Set initial Tick value of Timer1

Set Initial value of Tick via registers TMR_TICK1_0~TMR_TICK1_3 (address 0x634~0x637). Address 0x634 is lowest byte and 0x637 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Capture value of Timer1

Set registers TMR_CAPT1_0~TMR_CAPT1_3 (address 0x628~0x62b). Address 0x628 is lowest byte and 0x62b is highest byte.

3rd: Select GPIO source and edge for Timer1

Select certain GPIO to be the clock source via setting "m1" register.

Select positive edge or negative edge of GPIO input to trigger Timer1 Tick increment via setting "Polarity" register.

4th: Set Timer1 to Mode 1 and enable Timer1

Set address 0x620[5:4] to 2b'01 to select Mode 1; Meanwhile set address 0x620[3] to 1b'1 to enable Timer1. Timer1 starts counting upward, and Timer1 Tick value is increased by 1 on each positive/negative (specified during the 3rd step) edge of GPIO until it reaches Timer1 Capture value.

6.1.4 Mode2 (GPIO Pulse Width Mode)

In Mode 2, system clock is employed as the unit to measure the width of GPIO pulse. The "m0"/"m1" register specifies the GPIO which generates control signal for Timer0/Timer1.

After Timer is enabled, Timer Tick is triggered by a positive/negative (configurable) edge of GPIO pulse. Then Timer Tick (i.e. counting value) is increased by 1 on each positive edge of system clock from preset initial Tick value. Generally the initial Tick value is set to 0. The "Polarity" register specifies the GPIO edge when Timer Tick starts counting.

Note: Refer to **Section 8.1.2** for corresponding "m0", "m1" and "Polarity" register address.

While a negative/positive edge of GPIO pulse is detected, an interrupt is generated and timer stops counting. The GPIO pulse width could be calculated in terms of tick count and

period of system clock.

Steps of setting Timer0 for Mode 2 is taken as an example.

1st: Set initial Timer0 Tick value

Set Initial value of Tick via registers TMR_TICK0_0~TMR_TICK0_3 (address 0x630~0x633). Address 0x630 is lowest byte and 0x633 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Select GPIO source and edge for Timer0

Select certain GPIO to be the clock source via setting "m0" register.

Select positive edge or negative edge of GPIO input to trigger Timer0 counting start via setting "Polarity" register.

3rd: Set Timer0 to Mode 2 and enable Timer0

Set address 0x620[2:1] to 2b'10 to select Mode 2; Meanwhile set address 0x620 [0] to 1b'1 to enable Timer0.

Timer0 Tick is triggered by a positive/negative (specified during the 2nd step) edge of GPIO pulse. Timer0 starts counting upward and Timer0 Tick value is increased by 1 on each positive edge of system clock.

While a negative/positive edge of GPIO pulse is detected, an interrupt is generated and Timer0 tick stops.

4th: Read current Timer0 Tick value to calculate GPIO pulse width

Read current Timer0 Tick value from address 0x630~0x633.

Then GPIO pulse width is calculated as follows:

GPIO pulse width

$$= \text{System clock period} * (\text{current Timer0 Tick} - \text{intial Timer0 Tick})$$

For initial Timer0 Tick value set to the recommended value of 0, then:

$$\text{GPIO pulse width} = \text{System clock period} * \text{current Timer0 Tick.}$$

6.1.5 Mode3 (Tick Mode)

In Mode 3, system clock is employed.

After Timer is enabled, Timer Tick starts counting upward, and Timer Tick value is

increased by 1 on each positive edge of system clock.

This mode could be used as time indicator. There will be no interrupt generated. Timer Tick keeps rolling from 0 to 0xffffffff. When Timer tick overflows, it returns to 0 and starts counting upward again.

Steps of setting Timer0 for Mode 3 is taken as an example.

1st: Set initial Tick value of Timer0

Set Initial value of Tick via address 0x630~0x633. Address 0x630 is lowest byte and address 0x633 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Timer0 to Mode 3 and enable Timer0

Set address 0x620[2:1] to 2b'11 to select Mode 3, meanwhile set address 0x620[0] to 1b'1 to enable Timer0. Timer0 Tick starts to roll.

3rd: Read current Timer0 Tick value

Current Timer0 Tick value can be read from address 0x630~0x633.

6.1.6 Watchdog

Programmable watchdog could reset chip from unexpected hang up or malfunction.

Only Timer2 supports Watchdog.

Timer2 Tick has 32bits. Watchdog Capture has only 14bits, which consists of TMR_CTRL2 (address 0x622) [6:0] as higher bits and TMR_CTRL1 (address 0x621) [7:1] as lower bits. Chip will be reset when the Timer2 Tick[31:18] matches Watch dog capture.

1st: Clear Timer2 Tick value

Clear registers TMR_TICK2_0 ~TMR_TICK2_3 (address 0x638~0x63b). Address 0x638 is lowest byte and 0x63b is highest byte.

2nd: Enable Timer2

Set register TMR_CTRL0 (address 0x620) [6] to 1b'1 to enable Timer2.

3rd: Set 14-bit Watchdog Capture value and enable Watchdog

Set address 0x622[6:0] as higher bits of watchdog capture and 0x621[7:1] as lower bits. Meanwhile set address 0x622[7] to 1b'1 to enable Watchdog.

Then Timer2 Tick starts counting upwards from 0.

If bits[31:18] of Timer2 Tick value read from address 0x638~0x63b reaches watchdog capture, the chip will be reset.

6.2 32K LTIMER

The ST17H26 supports a low frequency (32KHz) LTIMER in suspend mode or deep sleep mode. This timer can be used as one kind of wakeup source.

Analog register 3V_reg35[7] should be set to 1b'1 to enable the LTIMER.

3V_reg16~3V_reg18[6:0] serve to configure timing value for the LTIMER with the unit of ms.

3V_reg18[7] serves to select mode for the LTIMER: continuous mode, or single mode. In continuous mode, when the LTIMER expires, the timing value is automatically reloaded, the counting value returns to zero and starts counting upwards again. In single mode, when the LTIMER expires, it stops counting.

3V_reg23[5] serves to select clock source for the LTIMER: 32K RC oscillator, or 16M Pad clock.

Current counting value can be read from 3V_reg32~3V_reg34 and 3V_reg35[6].

Table 6- 2 3.3V analog register table for LTIMER

Addr (Decimal)	Addr (Hexadecimal)	Name	Description	Default value

	0x23[2]	w/r	write 1 to clean digital wakeup status	
	0x23[3]	w/r	write 1 to clean pad wakeup status	
	0x23[4]	wd_status	write 1 to clean watch dog status.	
	0x23[5]	read only	rsvd	
	0x23[6]	read only	32k timer_cnt[24]	
	0x23[7]	w/r	32k timer enable toggle signal, write 1 to enable 32k timer	

6.3 System timer

The ST17H26 also supports a System Timer.

Table 6- 3 Register table for System Timer

Address	Mnemonic	R/W	Function	Default Value
0x740	Sys_timer[7:0]	R/W		00
0x741	Sys_timer[15:8]	R/W		00
0x742	Sys_timer[23:16]	R/W		00
0x743	Sys_timer[31:24]	R/W	System timer counter, write to set initial value. This is the sys timer counter	00

7 Interrupt System

7.1 Interrupt structure

The interrupting function is applied to manage dynamic program sequencing based on real-time events triggered by timers, pins and etc.

For the ST17H26, there are 24 interrupt sources in all: 16 types are level-triggered interrupt sources and 8 types are edge-triggered interrupt sources.

When CPU receives an interrupt request (IRQ) from some interrupt source, it will decide whether to respond to the IRQ. If CPU decides to respond, it pauses current routine and starts to execute interrupt service subroutine. Program will jump to certain code address and execute IRQ commands. After finishing interrupt service subroutine, CPU returns to the breakpoint and continues to execute main function.

7.2 Register configuration

Table 7- 1 Register table for Interrupt system

Address	Mnemonic	Type	Description	Reset Value
0x640	MASK_0	RW	Byte 0 interrupt mask, level-triggered type {irq_host_cmd irq_qdec, rsvd, irq_pwm, irq_dma, rsvd, time2, time1, time0} [7]: irq_host_cmd irq_qdec [6]: rsvd [5]: irq_pwm [4]: irq_dma [3]: rsvd [2]: time2 [1]: time1 [0]: time0	00
0x641	MASK_1	RW	Byte 1 interrupt mask, level-triggered type {an_irq, irq_software, irq_zb, rsvd, rsvd, rsvd, rsvd, rsvd} [7]: an_irq [6]: irq_software [5]: irq_zb [4]: rsvd [3]: rsvd [2]: rsvd [1]: rsvd [0]: rsvd	00
0x642	MASK_2	RW	Byte 2 interrupt mask, edge-triggered type {gpio2risc[0], rsvd, rsvd, rsvd, pm_irq, irq_gpio, rsvd, rsvd} [7]: gpio2risc[0] [6]: rsvd [5]: rsvd	00

Address	Mnemonic	Type	Description	Reset Value
			[4]: rsvd [3]: pm_irq [2]: irq_gpio [1]: rsvd [0]: rsvd	
0x643	IRQMODE	RW	[0] interrupt enable [1] reserved (Multi-Address enable)	00
0x644	PRI0_0	RW	Byte 0 of priority 1: High priority; 0: Low priority	00
0x645	PRI0_1	RW	Byte 1 of priority	00
0x646	PRI0_2	RW	Byte 2 of priority	00
0x648	IRQSRC_0	R	Byte 0 of interrupt source	
0x649	IRQSRC_1	R	Byte 1 of interrupt source	
0x64a	IRQSRC_2	R	Byte 2 of interrupt source	

7.2.1 Enable/Mask interrupt sources

Various interrupt sources could be enabled or masked by registers MASK_0~MASK_2 (address 0x640~0x642).

7.2.2 Interrupt mode and priority

Interrupt mode is typically-used mode. Register IRQMODE (address 0x643)[0] should be set to 1b'1 to enable interrupt function.

IRQ tasks could be set as High or Low priority via registers PRI0_0~PRI0_2 (address 0x644~0x646). When more than one interrupt sources assert interrupt requests at the same time, CPU will respond depending on respective interrupt priority levels. It's recommended not to modify priority setting.

7.2.3 Interrupt source flag

Three bytes in registers IRQSRC_0~IRQSRC_2 (address 0x648~0x64a) serve to indicate IRQ sources. Once IRQ occurs from certain source, the corresponding IRQ source flag will be raised to "High". User could identify IRQ source by reading address 0x648~0x64a.

When handling edge-triggered type interrupt, the corresponding IRQ source flag needs

to be cleared via address 0x64a. Take the interrupt source irq_gpio for example: First enable the interrupt source by setting address 0x642[2] to 1; then set address 0x643 [0] to 1 to enable the interrupt. In interrupt handling function, 24-bit data is read from address 0x648~0x64a to determine which IRQ source is valid; if data bit[18] is 1, it means the irq_gpio interrupt is valid. Clear this interrupt source by setting address 0x64a bit[2] to 1.

As for level-type interrupt, IRQ interrupt source status needs to be cleared via setting corresponding module status register. Take Timer0 IRQ interrupt source for example, register TMR_STATUS (address 0x623) [0] should be written with 1b'1 to clear Timer0 status (refer to **Section 6.1.1**).

8 Interface

8.1 GPIO

The ST17H26ET24 and ST17H26EP16/ST17H26ES16 supports up to 14 and 9 GPIOs, respectively. Except for dedicated GPIOs, all digital IOs can be used as general purpose IOs. Please refer to **Section 1.6** for available GPIO resources.

8.1.1 Basic configuration

8.1.1.1 Multiplexed functions

Please refer to Table 8-1 and Table 8-2 for various GPIO interface configuration.

Table 8- 1 GPIO lookup table 1 for the ST17H26ET24

Pin Name	Default Function	Priority0	Priority1	Priority2	Act as GPIO	Act as GPIO			Input Enable	DS (Drive Strength)
						OEN	Input	Output

GP23/ sda/ ANA3	GPIO input	sda			596[7]	592[7]]	590[7]	593[7]	591[7]	595[7]

***Notes:**

- (1) OEN: active low. 0: output enable.
- (2) Input Enable: active high. 1: input enable.
- (3) NA: no configuration.
- (4) Priority0 > Priority1 > Priority2.

The pins among GP0~GP32 (including GP4~GP5, GP7, GP9~GP10, GP17~GP18, GP22~GP23, GP30~GP31) are used as GPIO input function by default. For a pin with multiplexed function(s), to enable the function with lower priority, other function(s) with higher priority should be disabled first.

Take the **MCLK** as an example:

- (1) This pin acts as MCLK function by default.
- (2) To use the pin as GPIO function, address 0x5a6[2] should be set to 1b'1.

If the pin is used as output, its "OEN" register (address 0x5a2[2]) and "Input Enable" register (address 0x5a1[2]) should be cleared.

If the pin is used as input, its "OEN" register (address 0x5a2[2]) and "Input Enable" register (address 0x5a1[2]) should be set to 1b'1.

Take the **GP5/sda/pwm2_inv/pwm3** as another example:

- (1) This pin acts as GPIO input by default.
- (2) To use the pin as GPIO output, address 0x586[5] should be set to 1b'1, and addresses {0x582[5], 0x581[5]} should be cleared.
- (3) To use the pin as pwm3 function, addresses {0x586[5], 0x5d4[0]} should be cleared, and 0x5d4[1] should be set to 1b'1.
- (4) To use the pin as pwm2_inv function, addresses {0x586[5], 0x5d4[0], 0x5d4[1]} should be cleared.
- (5) As for its I2C interface function, please refer to **Section 8.2.1** for details.

Drive strength is set as the strongest drive level by default. Its value is configurable by related "DS" register. In actual applications, drive strength can be decreased to lower level if necessary.

8.1.1.2 Drive strength

The registers in the “DS” column are used to configure corresponding pin’s driving strength: “1” indicates maximum drive level, while “0” indicates minimal drive level. The “DS” configuration will take effect when the pin is used as output. It’s set as the strongest driving level by default. In actual applications, driving strength can be decreased to lower level if necessary.

As shown in Table 8-3 and Table 8-4, all the GPIO pins support maximum drive level of 4mA (“DS”=1) and minimal drive level of 0.7mA (“DS”=0) with the following exceptions:

- ✧ MCLK, MSDO, MSDI and MSCN: maximum=4mA (“DS”=1), minimum=2mA (“DS”=0);
- ✧ SWS: maximum=8mA (“DS”=1), minimum=4mA (“DS”=0).

Table 8- 3 IO drive strength for ST17H26ET24

No.	Pin Name	Drive Strength	
		“DS”=0	“DS”=1
1	MSDO	2mA	4mA
2	MSDI	2mA	4mA
3	MSCN	2mA	4mA
4	SWS	4mA	8mA
5	GP9/pwm0 #	0.7mA	4mA
6	GP10/pwm1 #	0.7mA	4mA
11	GP17/pwm2_inv/ANA0 *	0.7mA	4mA

11	GP23/sda/ANA3 *	0.7mA	4mA

8.1.2 Connection relationship between GPIO and related modules

GPIO can be used to generate GPIO interrupt signal for interrupt system, as well as counting or control signal for Timer/Counter module.

For the “Exclusive Or (XOR)” operation result for input signal from any GPIO pin and respective “polarity” value, on one hand, it takes “And” operation with “irq” and generates GPIO interrupt request signal; on the other hand, it takes “And” operation with “m0/m1” and generates counting signal in Mode 1 or control signal in Mode 2 for Timer0/Timer1.

GPIO interrupt request signal = $| ((\text{input} \wedge \text{polarity}) \& \text{irq})$;

Counting (Mode 1) or control (Mode 2) signal for Timer0 = $| ((\text{input} \wedge \text{polarity}) \& \text{m0})$;

Counting (Mode 1) or control (Mode 2) signal for Timer1 = $| ((\text{input} \wedge \text{polarity}) \& \text{m1})$;

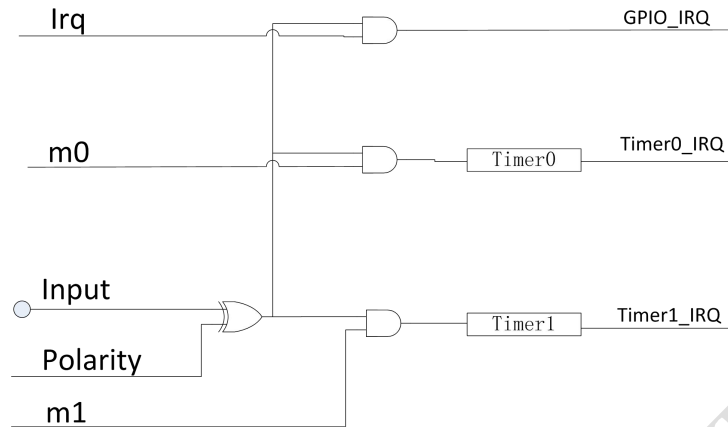

Figure 8- 1 Logic relationship between GPIO and related modules

Please refer to Table 8-5 and Table 8-6 to learn how to configure GPIO for interrupt system or Timer0/Timer1 (Mode 1 or Mode 2).

- (1) First enable GPIO function, IE and disable OEN.
- (2) GPIO IRQ signal: Select GPIO interrupt trigger edge (positive edge or negative edge) via configuring "Polarity" register, and set corresponding GPIO interrupt enabling bit "Irq" register. Finally enable GPIO interrupt (address 0x642[2]).

User can read addresses {0x5c0 ~ 0x5c3, 0x5d0} to see which GPIO asserts GPIO interrupt request signal. Note: 0x5c0[4] --> GP4, 0x5c0[5] --> GP5, 0x5c0[7] --> GP7, 0x5c1[1] --> GP9, 0x5c1[2] --> GP10, 0x5c2[1] --> GP17, 0x5c2[2] --> GP18, 0x5c2[6] --> GP22, 0x5c2[7] --> GP23, 0x5c3[6] --> GP30, 0x5c3[7] --> GP31, 0x5d0[1] --> MSCN, 0x5d0[2] --> MCLK, 0x5d0[3] --> MSDO, 0x5d0[4] --> MSDI, 0x5d0[5] --> SWS.

- (3) Timer/Counter counting or control signal: Configure "Polarity" register (In Mode 1, it determines GPIO edge when Timer Tick counting increases; in Mode 2, it determines GPIO edge when Timer Tick starts counting) and set "m0/m1" register.

User can read addresses {0x5c4~0x5c7, 0x5d1}/{0x5c8~0x5cb, 0x5d2} to see which GPIO asserts counting signal (in Mode 1) or control signal (in Mode 2) for Timer0/Timer1. Note: {0x5c4[4] --> GP4, 0x5c4[5] --> GP5, 0x5c4[7] --> GP7, 0x5c5[1] --> GP9, 0x5c5[2] --> GP10, 0x5c6[1] --> GP17, 0x5c6[2] --> GP18, 0x5c6[6] --> GP22, 0x5c6[7] --> GP23, 0x5c7[6] --> GP30, 0x5c7[7] --> GP31, 0x5d1[1] --> MSCN, 0x5d1[2] --> MCLK, 0x5d1[3] --> MSDO, 0x5d1[4] --> MSDI, 0x5d1[5] --> SWS}/

{0x5c8[4] --> GP4, 0x5c8[5] --> GP5, 0x5c8[7] --> GP7, 0x5c9[1] --> GP9, 0x5c9[2] --> GP10, 0x5ca[1] --> GP17, 0x5ca[2] --> GP18, 0x5ca[6] --> GP22, 0x5ca[7] --> GP23, 0x5cb[6] --> GP30, 0x5cb[7] --> GP31, 0x5d2[1] --> MSCN, 0x5d2[2] --> MCLK, 0x5d2[3] --> MSDO, 0x5d2[4] --> MSDI, 0x5d2[5] --> SWS}.

Table 8- 5 GPIO lookup table 2 for the ST17H26ET24

Pin	Input (R)	Polarity 1: active low 0: active high	Irq	m0	m1

8.2 I2C

The ST17H26 embeds I2C hardware module, which could only act as Slave mode. I2C is

a popular inter-IC interface requiring only 2 bus lines, a serial data line (SDA) and a serial clock line (SCL).

8.2.1 Pin configuration

Table 8-7 shows I2C interface configuration and priority:

Table 8- 7 I2C pin configuration

a) ~586[5] & 5d4[0]	GP4/GP5 (Reserved for ST17H26ET24)
b) ~58e[5]	Reserved (GP12/GP13)
c) ~596[7]	GP22/GP23
d) ~59e[7]	GP30/GP31
Priority: a) > b) > c) > d)	

To use GP4 and GP5 of the ST17H26EP16/ ST17H26ES16 as I2C_SCL and I2C_SDA respectively, address 0x586[5] should be cleared and 0x5d4[0] should be set to 1b'1.

To use GP22 and GP23 of the ST17H26ET24 as I2C_SCL and I2C_SDA respectively, address 596[7] should be cleared, meanwhile GP5 should not be configured as I2C_SDA function.

It's noted that the I2C_SCL pin must be configured as "input" via setting the corresponding "Input Enable" register to 1b'1.

8.2.2 Lenze I2C communication protocol

Lenze I2C module supports standard mode (100kbps), Fast-mode (400kbps), Fast-mode plus (1Mbps) and High-speed mode (3.4Mbps) with restriction that system clock must be by at least 10x of data rate.

Two wires, SDA and SCL carry information between Master device and Slave device connected to the bus. Each device is recognized by unique address. Master device is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. Slave device is the device addressed by a master.

Both SDA and SCL are bidirectional lines connected to a positive supply voltage via a

pull-up resistor. When the bus is free, both lines are HIGH. It's noted that data in SDA line must keep stable when clock signal in SCL line is at high level, and level state in SDA line is only allowed to change when clock signal in SCL line is at low level.

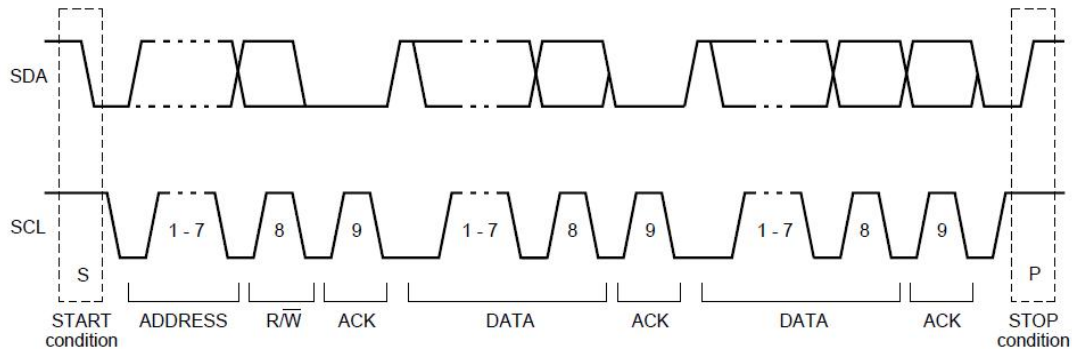

Figure 8- 2 I2C timing chart

8.2.3 Register table

Table 8- 8 Register table for I2C

Address	Name	R/W	Description	Reset Value
0x00	rsvd	RW		
0x01	I2CID	RW	I2C ID	0x5c
0x02	rsvd	RW

			have happened and is read operation r/o[2]:host_cmd_wr:i2c host operation have happened and is write operation	
0x22	irq		[0]: write 1 clear software_irq, read software irq status [1]: write 1 clear an_irq , read an_irq status [2]: write 1 clear host_pkt_irq, read host_pkt_irq status [3] rsvd [4] write 1 to trigger software irq	
0x3e	Reg_host_map_adrl	R/W	I2C mapping[7:0]: Lower byte of Mapping mode buffer address	0x80
0x3f	Reg_host_map_adrh	R/W	I2C mapping[15:8]: Higher byte of Mapping mode buffer address	0x9f

8.2.4 I2C Slave mode

The I2C of the ST17H26 can only be used as Slave. I2C slave address could be configured in I2CID (address 0x01) [7:1].

Figure 8- 3 I2C slave address

In I2C Slave mode, Master could initiate transaction anytime. I2C slave module will reply ACK automatically.

Sub modes including Direct Memory Access (DMA) mode, Mapping mode and a specific “Command Analysis” mode are supported. The latter is designed specially for the user who wants to define and use his own I2C protocol and read/write format.

8.2.4.1 DMA mode

In DMA mode, other devices (Master) could read/write Register and/or SRAM of the ST17H26 via I2C protocol, and initial access address is specified by I2C Master. In this mode, I2C Slave will execute the read/write command from I2C Master automatically. But user needs to notice that the lowest system clock shall be 10x faster than I2C bit rate.

The access address is offset by 0x800000. In ST17H26, Register address starts from 0x800000 and SRAM address starts from 0x808000. For example, if Addr(High) is 0xaa and Addr(Low) is 0xcc, the real address of accessed data is 0x80aacc.

Master could access data of the ST17H26 via I2C byte by byte, and access address supports automatical increment by setting address 0x03[0] to 1.

Read Format in DMA mode

Figure 8- 4 Read format in I2C DMA mode

Write Format in DMA mode

Figure 8- 5 Write format in I2C DMA mode

8.2.4.2 Mapping mode

Address 0x03[2] should be set to 1b'1 to enable Mapping mode.

In Mapping mode, data written and read by I2C master will be redirected to specified 128-byte buffer in SRAM. The initial address of the 128-byte buffer is configurable via addresses 0x3e~0x3f. Address 0x3e is lower byte and address 0x3f is higher byte. The first 64-byte buffer is for written data and following 64-byte buffer is for read data. Every time the data access will start from the beginning of the Write-buffer/Read buffer after I2C stop condition occurs.

Read Format in mapping mode

Figure 8- 6 Read format in I2C Mapping mode

Write Format in mapping mode

Figure 8- 7 Write format in I2C Mapping mode

8.2.4.3 Command analysis mode

For I2C Master that uses self-defined I2C protocol and read/write format, a specific “Command Analysis” mode is supported by the I2C of the ST17H26 (Slave).

I2C Master should specify initial access address as 0x20 (offset by 0x800000) in DMA mode, or configure mapping mode buffer address registers (addresses 0x3e~0x3f) as 0x800020 in mapping mode, by sending command to I2C Slave. I2C Slave supports command analysis function. By reading address 0x21[2:1], user can know whether the I2C Master operation that just happened is read or write operation.

8.3 SWS

The ST17H26 supports SWS (Single Wire Slave) interface which represents the slave

device of the single wire communication system developed by Lenze. The maximum data rate can be up to 2Mbps.

8.4 Pull-up/Pull-down resistor

For the ST17H26, the GPIOs including GP17~GP18, GP22~GP23 and GP31 support configurable 1MΩ/10KΩ pull-up resistor or 100KΩ pull-down resistor; the GPIOs including GP4~GP5, GP7 and GP9~GP10 support 100KΩ pull-down resistor. Related register configuration can be found in Table 8-9. By default the pull-up and pull-down resistors are disabled.

Take the GP17 as an example: Setting analog register afe3V_reg08<1:0> to 2b'01/2b'10/2b'11 is to enable 1MΩ pull-up resistor/10KΩ pull-up resistor/100KΩ pull-down resistor respectively for GP17; Clearing the two bits disables pull-up and pull-down resistors for GP17.

Table 8- 9 3.3V analog registers related to Pull-up/Pull-down resistor

Address(bit)	Mnemonic	Reset value	Description

9 Quadrature Decoder

The ST17H26 embeds one quadrature decoder (QDEC) which is designed mainly for applications such as wheel. The QDEC implements debounce function to filter out jitter on the two phase inputs, and generates smooth square waves for the two phase.

9.1 Input pin selection

The QDEC supports two phase input; each input is selectable from the 6 dedicated GPIOs including GP17~GP18, GP22~GP23 and GP30~GP31 via setting address 0xd2[4:0] (for channel a)/0xd3[4:0] (for channel b).

Table 9- 1 Input pin selection

Address 0xd2[4:0]/0xd3[4:0]	Pin
0	Reserved (GP16)
1	GP17
2	GP18
3	Reserved (GP19)
4	Reserved (GP20)
5	Reserved (GP21)
6	GP22
7	GP23
8	Reserved (GP24)
9	Reserved (GP25)
10	Reserved (GP26)
11	Reserved (GP27)
12	Reserved (GP28)
13	Reserved (GP29)
14	GP30
15	GP31

9.2 Common mode and double accuracy mode

The QDEC embeds an internal hardware counter, which is not connected with bus.

Address 0xd7[0] serves to select common mode or double accuracy mode.

For each wheel rolling step, two pulse edges (rising edge or falling edge) are generated.

If address 0xd7[0] is cleared to select common mode, the QDEC Counter value (real time

counting value) is increased/decreased by 1 only when the same rising/falling edges are detected from the two phase signals.

Figure 9- 1 Common mode

If address 0xd7[0] is set to 1b'1 to select double accuracy mode, the QDEC Counter value (real time counting value) is increased/decreased by 1 on each rising/falling edge of the two phase signals; the QDEC Counter value will be increased/decreased by 2 for one wheel rolling.

Figure 9- 2 Double accuracy mode

9.3 Read real time counting value

Neither can Hardware Counter value be read directly via software, nor can the counting value in address 0xd0 be updated automatically.

To read real time counting value, first write address 0xd8[0] with 1b'1 to load Hardware

Counter data into the QDEC_COUNT register, then read address 0xd0.

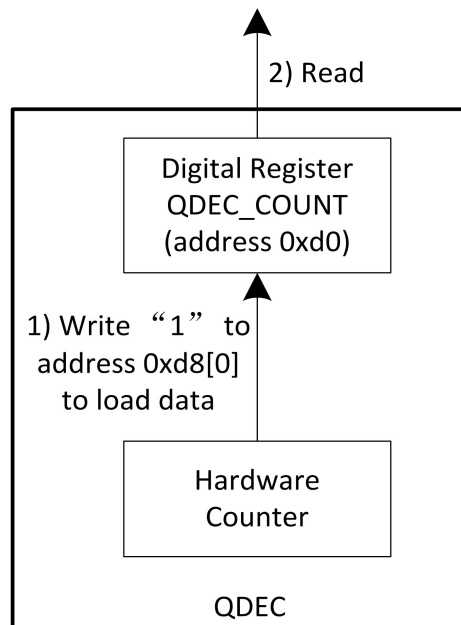

Figure 9- 3 Read real time counting value

9.4 QDEC interrupt

Address 0xd4[0] serves to enable or mask QDEC interrupt.

If address 0xd4[0] is set to 1b'1 to enable QDEC interrupt, whenever counter value changes, an QDEC IRQ is asserted and address 0xd5[0] is set to 1b'1 automatically. Writing 1b'1 to address 0xd5[0] can clear the interrupt flag bit.

9.5 QDEC reset

Address 0xd6[0] serves to reset the QDEC. The QDEC Counter value is cleared to zero.

9.6 Other configuration

The QDEC supports hardware debouncing. Address 0xd1[2:0] serves to set filtering window duration. All jitter with period less than the value will be filtered out and thus does not trigger count change.

Address 0xd1[4] serves to set input signal initial polarity.

Address 0xd1[5] serves to enable shuttle mode. Shuttle mode allows non-overlapping

two phase signals as shown in the following figure.

Figure 9- 4 Shuttle mode

9.7 Register table

10 SAR ADC

The ST17H26 integrates one ADC module, which can be used to sample battery voltage and external analog input.

10.2 SAR ADC clock

ADC clock derives from FHS. Address 0x6b[7] should be set to “1” to enable ADC clock.

ADC clock must be lower than 5M when ADC reference voltage is selected as VDDH and must be lower than 4M when ADC reference voltage is selected as Vbg.

ADC clock is calculated according to the formula below:

$$F_{\text{ADC clock}} = F_{\text{FHS}} * \text{adc_step}[10:0] / \text{adc_mod}[11:0]$$

Refer to Section 5.2.1 for details.

10.3 Select ADC range, resolution and sampling time

ADC range is same as the ADC reference voltage, which is configured by register 0x2b[0]: Vbg (1.26V bandgap reference), or VDDH.

Address 0x3c[4:3] serves to set resolution: 7bit, 8bit, 9bit or 10bit. ADC data format is always 10bit no matter the conversion bit is set. Address 0x3c[5] serves to set the sign of

ADC output data bit[9] as positive or negative. For example, 8 bits resolution indicates higher 8 bits are valid bits and the lower 2 bits are invalid bits.

ADC sampling time can be configured by address 0x3c[2:0], the lower sampling cycle, the shorter ADC convert time.

10.4 Select input mode and channel

The ST17H26 ADC has 4 input channel which can be selected by address 0x2c[2:0].

Address 0x2c[5:4] serves to select differential mode or single-end input mode.

When address 0x2c[5:4] is set to 2b'00 to select single-end mode, 0x2c[2:0] serves to select input channel.

When address 0x2c[5:4] is set to 2b'01/2b'10/2b'11, differential mode is selected, the corresponding channel identified by address 0x2c[5:4] is selected as negative input, and the positive input is selectable via address 0x2c[2:0].

For example, if address 0x2c is set to 0x11 (i.e. 8b'00010001), GP17 and GP18 are selected as positive-end and negative-end input of differential mode; actual input signal for ADC is the difference of V_{GP17} and V_{GP18} (i.e. V_{GP17} minus V_{GP18}).

10.5 ADC start

Address 0x35[7] set to "1" starts ADC sampling and conversion process.

10.6 ADC status

ADC busy flag bit, i.e. address 0x39[7], indicates whether ADC is busy.

10.7 ADC data

The real time output data ADC_DAT[9:0] can be read from addresses 0x39~0x38.

11 PWM

The ST17H26 supports 4-channel PWM (Pulse-Width-Modulation) output. PWM#n_INV indicates inverted output corresponding to PWM#n.

11.1 Register table

Table 11- 1 Register table for PWM

11.2 Enable PWM

Register PWM_EN (address 0x780)[3:0] serves to enable PWM3~PWM0 respectively via writing “1” for the corresponding bits.

11.3 Set PWM clock

PWM clock derives from system clock. Register PWM_CLK (address 0x781) serves to set the frequency dividing factor for PWM clock. Formula below applies:

$$F_{PWM} = F_{System\ clock} / (PWM_CLK + 1)$$

11.4 PWM waveform, polarity and output inversion

Each PWM channel has independent counter and three status including “Delay”, “Count” and “Remaining”. Count and Remaining status form a signal frame.

11.4.1 PWM waveform

When PWM#n is enabled, PWM#n enters Delay status. By default PWM#n outputs Low level at Delay status. The Delay status duration, i.e. Phase time, is configured in register PWM_PHASE#n (address 0x788~0x78f). Phase difference between PWM channels is allowed by different phase time configuration.

After Phase time expires, PWM#n exits Delay status and starts to send signal frames. First PWM#n is at Count status and outputs High level signal by default. When PWM#n counter reaches cycles set in register PWM_TCMP#n (address 0x794~0x795, 0x798~0x799, 0x79c~0x79d, 0x7a0~0x7a1), PWM#n enters Remaining status and outputs Low level till PWM#n cycle time configured in register PWM_TMAX#n (address 0x796~0x797, 0x79a~0x79b, 0x79e~0x79f, 0x7a2~0x7a3) expires.

An interruption will be generated at the end of each signal frame if enabled via register PWM_MASK (address 0x7b0[2:5]).

11.4.2 Invert PWM output

PWM#n and PWM#n_INV output could be inverted independently via register PWM_CC0 (address 0x783[3:0]) and PWM_CC1 (address 0x784[3:0]). When the inversion bit is enabled, the corresponding PWM channel waveform will be inverted completely.

11.4.3 Polarity for signal frame

By default, PWM#n outputs High level at Count status and Low level at Remaining status. When the corresponding polarity bit is enabled via register PWM_CC2 (address 0x785[3:0]), PWM#n will output Low level at Count status and High level at Remaining status.

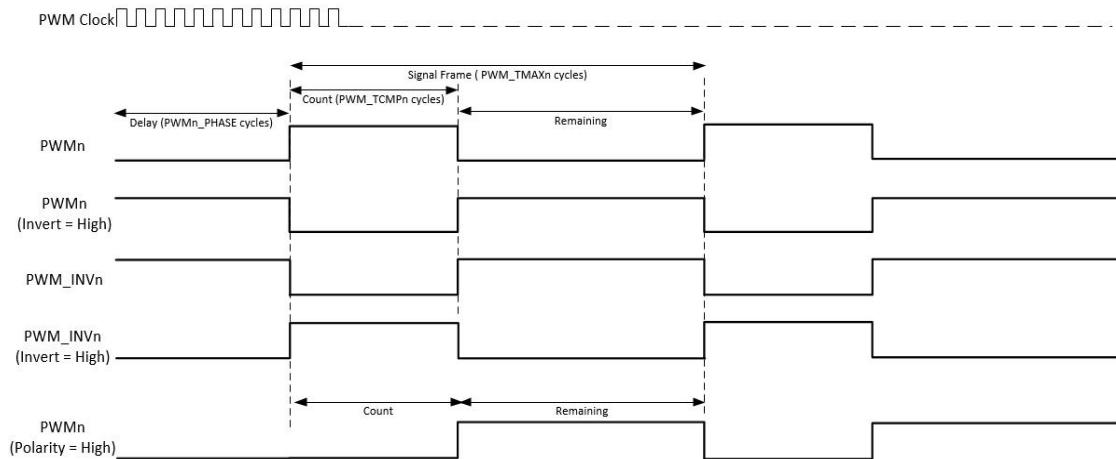

Figure 11- 1 PWM output waveform chart

11.5 PWM mode

11.5.1 Select PWM mode

PWM0 supports 2 modes, including Continuous (normal) mode and Counting mode. PWM1~PWM3 only support Continuous mode.

Register PWM_MODE (address 0x782[1:0]) serves to select PWM0 mode.

11.5.2 Continuous mode

PWM0~PWM3 all support Continuous mode. In this mode, PWM#n continuously sends out signal frames. PWM#n should be disabled via address 0x780 to stop it; when stopped, the PWM output will turn low immediately.

During Continuous mode, waveform could be changed freely. New configuration for PWM_TCMP#n and PWM_TMAX#n will take effect in the next signal frame.

A frame interruption will be generated (if enabled) after each signal frame is finished.

Figure 11- 2 Continuous mode

11.5.3 Counting mode

Only PWM0 supports Counting mode. In this mode, PWM0 sends out specified number of signal frames which is defined as a pulse group. The number is configured via register PWM_PNUM0 (address 0x7ac~0x7ad). After a pulse group is finished, PWM0 will be disabled automatically, and a Pnum interruption will be generated if enabled via register PWM_MASK (address 0x7b0[0]).

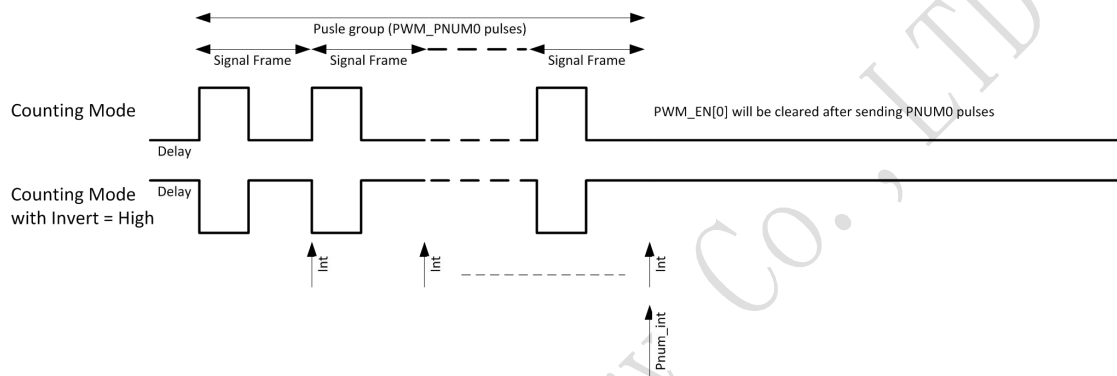

Figure 11- 3 Counting mode

11.6 PWM interrupt

There are 5 interrupt sources from PWM function. After each signal frame, PWM#n will generate a frame-done IRQ (Interrupt Request) signal. In Counting mode, PWM0 will generate a Pnum IRQ signal after completing a pulse group. Interrupt status can be cleared via register PWM_INT (address 0x7b1).

12 Key Electrical Specifications

12.1 Absolute maximum ratings

Table 12- 1 Absolute Maximum Ratings

Characteristics	Sym.	Min.	Max	Unit	Test Condition
Supply Voltage	VDD	-0.3	3.9	V	All AVDD and DVDD pin must have the same voltage
Voltage on Input Pin	V _{In}	-0.3	VDD +0.3	V

Sensitivity	1Mbps		-94		dBm	
Frequency Offset Tolerance		-300		300	KHz	
Co-channel rejection			-3		dB	
In-band blocking rejection (Single Tone Interference)	±1 MHz offset		3		dB	
	-2 MHz offset		33		dB	
	+2 MHz offset		30		dB	
	-3 MHz offset		33		dB	
	+3 MHz offset		34		dB	
	>4MHz offset		35		dB	
In-band blocking rejection (Equal Modulation Interference)	±1MHz offset		-3		dB	
	-2 MHz offset		26		dB	
	+2 MHz offset		22		dB	
	-3 MHz offset		31		dB	

Item	Sym.	Min	Typ.	Max	Unit	Condition
	+3 MHz offset		35		dB	
	>4MHz offset		32		dB	
Image rejection			44		dB	
RF_Tx performance						
Output power				6	dBm	
Modulation 20dB bandwidth			1.3		MHz	
16MHz crystal						
Nominal frequency (parallel resonant)	f_{NOM}		16		MHz	
Frequency tolerance	f_{TOL}	-60		+60	ppm	
Load capacitance	C_L	5	12	18	pF	Programmable on chip load cap
Equivalent series resistance	ESR		50	100	ohm	
32MHz RC oscillator						
Nominal frequency	f_{NOM}		32		MHz	
Frequency tolerance	f_{TOL}		1		%	On chip calibration
32kHz RC oscillator						
Nominal frequency	f_{NOM}		32		kHz	
Frequency tolerance	f_{TOL}		0.03		%	On chip

Item	Sym.	Min	Typ.	Max	Unit	Condition
						calibration
Calibration time			3		ms	
ADC						
Differential nonlinearity	DNL		0.8		LSB	
Integral nonlinearity	INL		0.7		LSB	
Signal-to-noise and distortion ratio (fin=1kHz, fS=16kHz)	SINAD		57.8		dB	
Spurious free dynamic range (fin=1kHz, fS=16kHz)	SFDR		64.5		dB	
Effective Number of Bits	ENOB		9.2		bits	
Sampling frequency	Fs			250	KHz	VDDH reference
				200	KHz	Vbg reference
